

SCRUM MEETING REPORT

Project Name: Flood Monitoring System (FMS)

Sprint Number: 3

Date: February 22, 2026

Time: 14:36 AST (UTC-4)

Location: Halifax, Nova Scotia

Participant

- Benjamin

1. Goals of the Meeting

This meeting was focused on regrouping and making sure the project is moving forward in a clear and organized way. With the updated project name now finalized as the Flood Monitoring System (FMS), the goal was to make sure everything going forward reflects that change.

The main objectives were:

1. Reconfirm what the system is responsible for and what is outside its scope.
2. Finalize a clear description of how the system works at a high level.
3. Confirm the structure of the Level 0 and Level 1 data flow diagrams.
4. Decide on the main data components that will form the backbone of the database.
5. Prepare for building the database structure in SQL Server.

2. Discussion Topics

Topic 1: Clarifying the System's Role

The Flood Monitoring System was clearly defined as a structured platform that stores processed flood-related information, not raw satellite images. The satellite data is accessed and prepared using Google Earth Engine, but the FMS is responsible for organizing, storing, and managing the results in a way that allows for analysis and reporting. This helps keep the system focused and avoids unnecessary complexity.

Topic 2: Organizing the System Flow

The overall flow of information was reviewed. At the highest level, the system interacts with external sources such as Copernicus Sentinel data, Google Earth Engine, and the end user. Internally, the system follows a logical flow: bringing in data, storing results, generating flood classifications, and supporting reporting. The goal is to make sure the diagrams clearly reflect how information moves through the system without overcomplicating the design.

Topic 3: Planning the Database Structure

The core pieces of information the system needs to track were identified. These include geographic areas, satellite image records, processed results, flood classifications, and basic tracking logs. The database will be structured carefully to avoid duplication and to ensure everything connects logically. The focus is on building a clean, organized foundation before moving forward with more advanced work.

Impediments Identified:

- No external blockers at this time.
- The database structure must be clearly finalized before continuing with model development to prevent rework.

3. Action Items

Table 1. Action Items

Action Item	Assigned To	Due Date	Status
Finalize written system scope description	Benjamin	02/23/26	X In Progress
Complete DFD Level 0	Benjamin	02/23/26	X In Progress
Complete DFD Level 1	Benjamin	02/24/26	☐ Open
Draft ERD structure	Benjamin	02/25/26	☐ Open
Prepare initial SQL database script	Benjamin	02/26/26	☐ Open

4. Decisions

Decision 1: A FloodEvent will represent a flood classification for a specific area on a specific date, based on processed satellite data.

Rationale: This keeps the design simple, organized, and aligned with the assignment requirements.

Decision 2: The database structure must be completed and tested before any further model development continues.

Rationale: Finalizing the structure first ensures stability and prevents unnecessary redesign later.

5. Next Meeting

Date: 03/01/26

Time: 15:00 (AST, UTC-4)

Preparation Required: Review completed diagrams and bring a draft of the database layout for review.
